In our digital world maker skills are more important than ever. Becoming a maker unleashes creative power and boosts self-confidence.

In this booklet we give you five reasons why we think everyone should make.

With home-made love,
Astrid Poot

1: Making is a bridge

When you experience a lot of tools and techniques from a very young age you'll benefit all your life.

You develop a healthy (maker-) self-confidence and experience numerous times that new things can be mastered. You build a bridge in your head! Technology and making simply becomes a tool to express yourself.

3: To understand is to invent

You can find all answers to your questions on the Internet. But when it stops there, knowledge tends to stay theoretical. You learn more by experience.

Only when you really understand something, it can become your tool. And then there are no limits to what you can build!

2: The maker-mindset is een growth mindset

A lot of makers use tech in a playful manner: they build an existing product into something else.

Everything around them is material or an idea. They are fearless when it comes to inventing as they go along. People that can look at problems with curiosity solve them more easily.

A friend recently told me that only 3% of ideas emerge behind a computer screen or desk. Makers (and knitting grannies) know this.

4: Making trains the brain

Making things with your hands leads to new thoughts in your head. The product is not the only goal; the process is important too.

5: If you can't see it, you can't be it

You have to know tools and materials to be able to use them in your projects. You can't work with it, or think with it, if you've never felt it. More experience provides a bigger mental en physical toolbox.

Five reasons for making!
